

LINEAR POWER LTD.

***ULTRA-LOW  
TEMPERATURE POWER  
CYCLE ENGINE***

A New Approach to Getting More  
Power from a Heat Source –  
Creating a Higher Carnot Thermal  
Efficiency

The Carnot Thermal Efficiency is Solely Determined by the Temperature Difference Between the High-Temperature Heat Reservoir and the Temperature of the Low-Temperature Heat Reservoir used for Heat Rejection – the Delta Temperature.

How can the Temperatures of the Power Cycle  
be Enhanced in order to get a Higher  
Temperature as an Enhanced Heat Source and a  
Lower Temperature for Heat Rejection for an  
Ultra-Low Temperature Resource in Ranges  
Below 125 deg F. (51.7 deg. C)?

And, What is the Best Method to  
get the Most Power from the  
Amount of Thermal Energy  
Available (Your Heat Source)?

# The Answer to Question Number One

Adiabatic Compression, Heat Removal (to the Power Cycle) and Expansion of Moist air in order to Create a Closed-Loop Evaporative Cooling (for Heat Rejection) and Condensation Heating Process that Results in Enhanced Temperatures for the Power Cycle thereby Producing a Higher Carnot Thermal Efficiency for the Power Cycle, increasing the high temperature and reducing the low temperature.

# The Answer to Question Number Two

Operate the Power Cycle Solely in the Gaseous Phase (Sensible Heat) that requires only a Fraction as Many BTUs as compared to Power Cycles like the Rankine Cycle that cause Phase Change (Latent Heat). As Many as Ten Times the BTUs are Used for Phase Change.

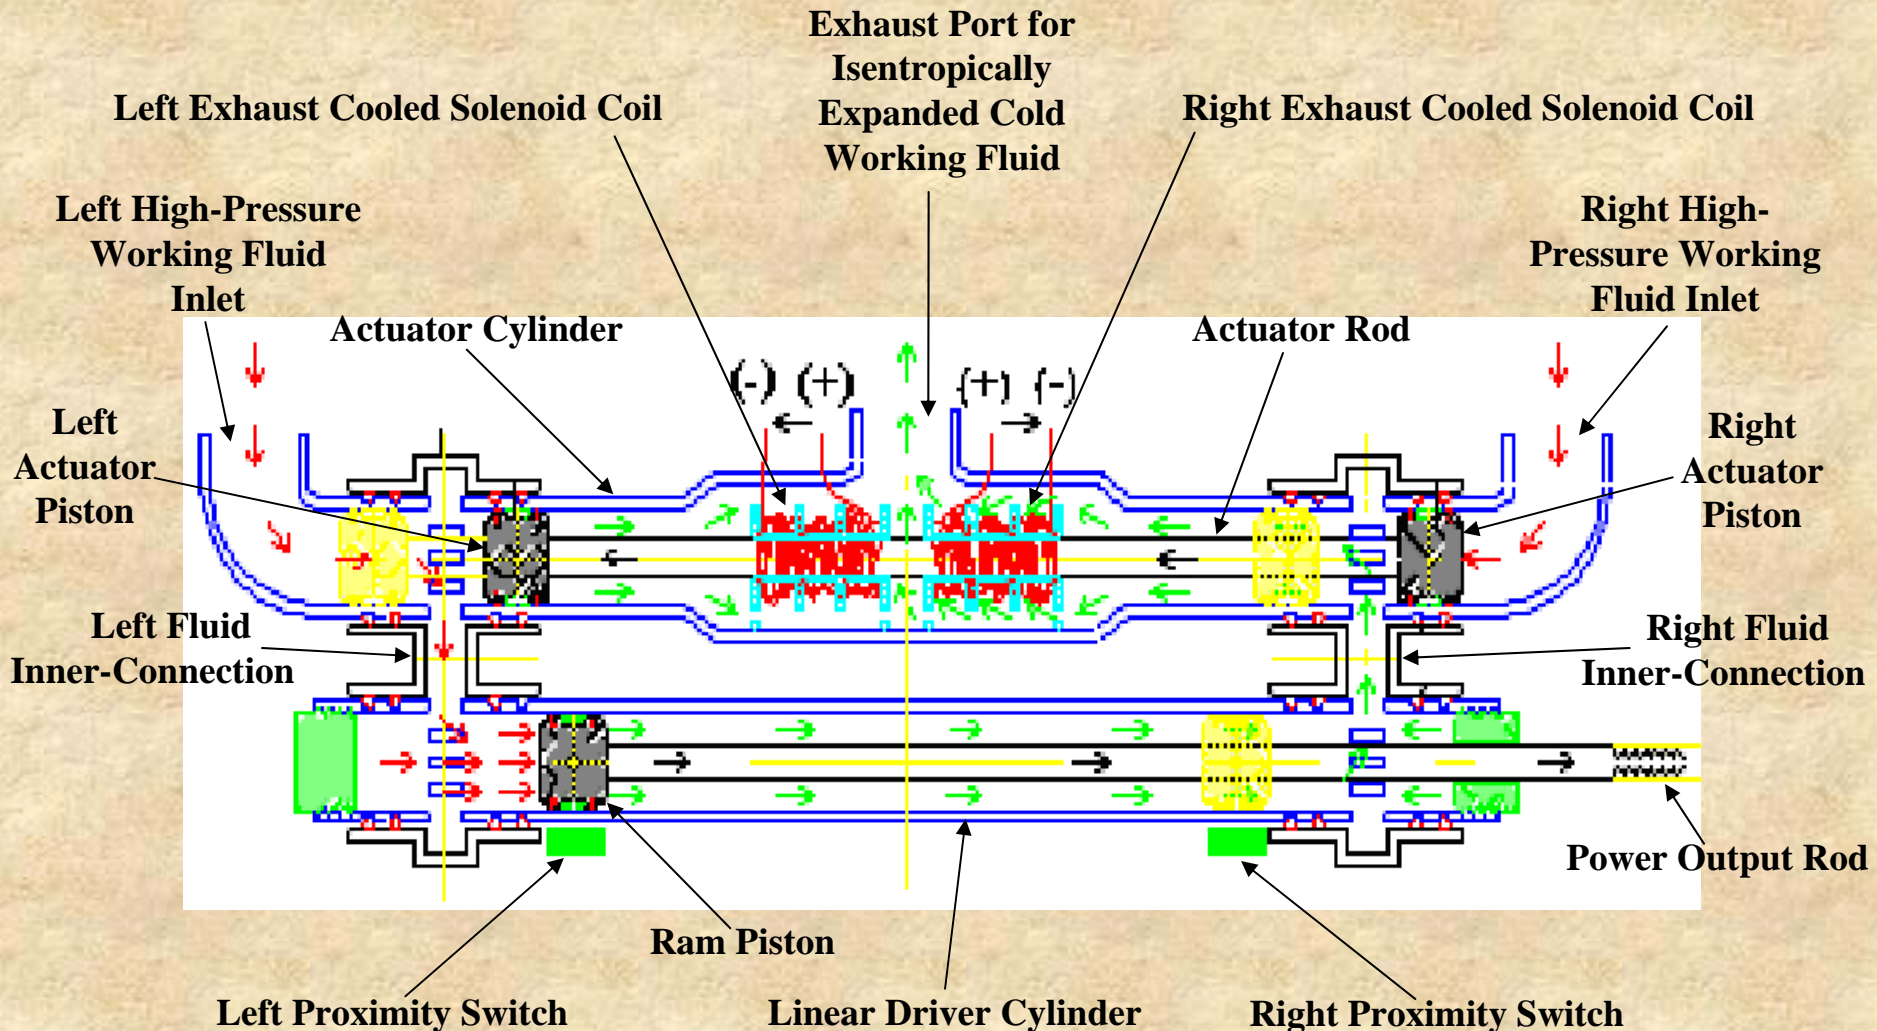

# The Core Components of Equipment Developed by Linear Power, Ltd. to Accomplish the Ultra-Low Temperature Power Cycle

International Patent Applications  
have been filed for all of the  
following devices by Robert D. Hunt  
on behalf of Linear Power.

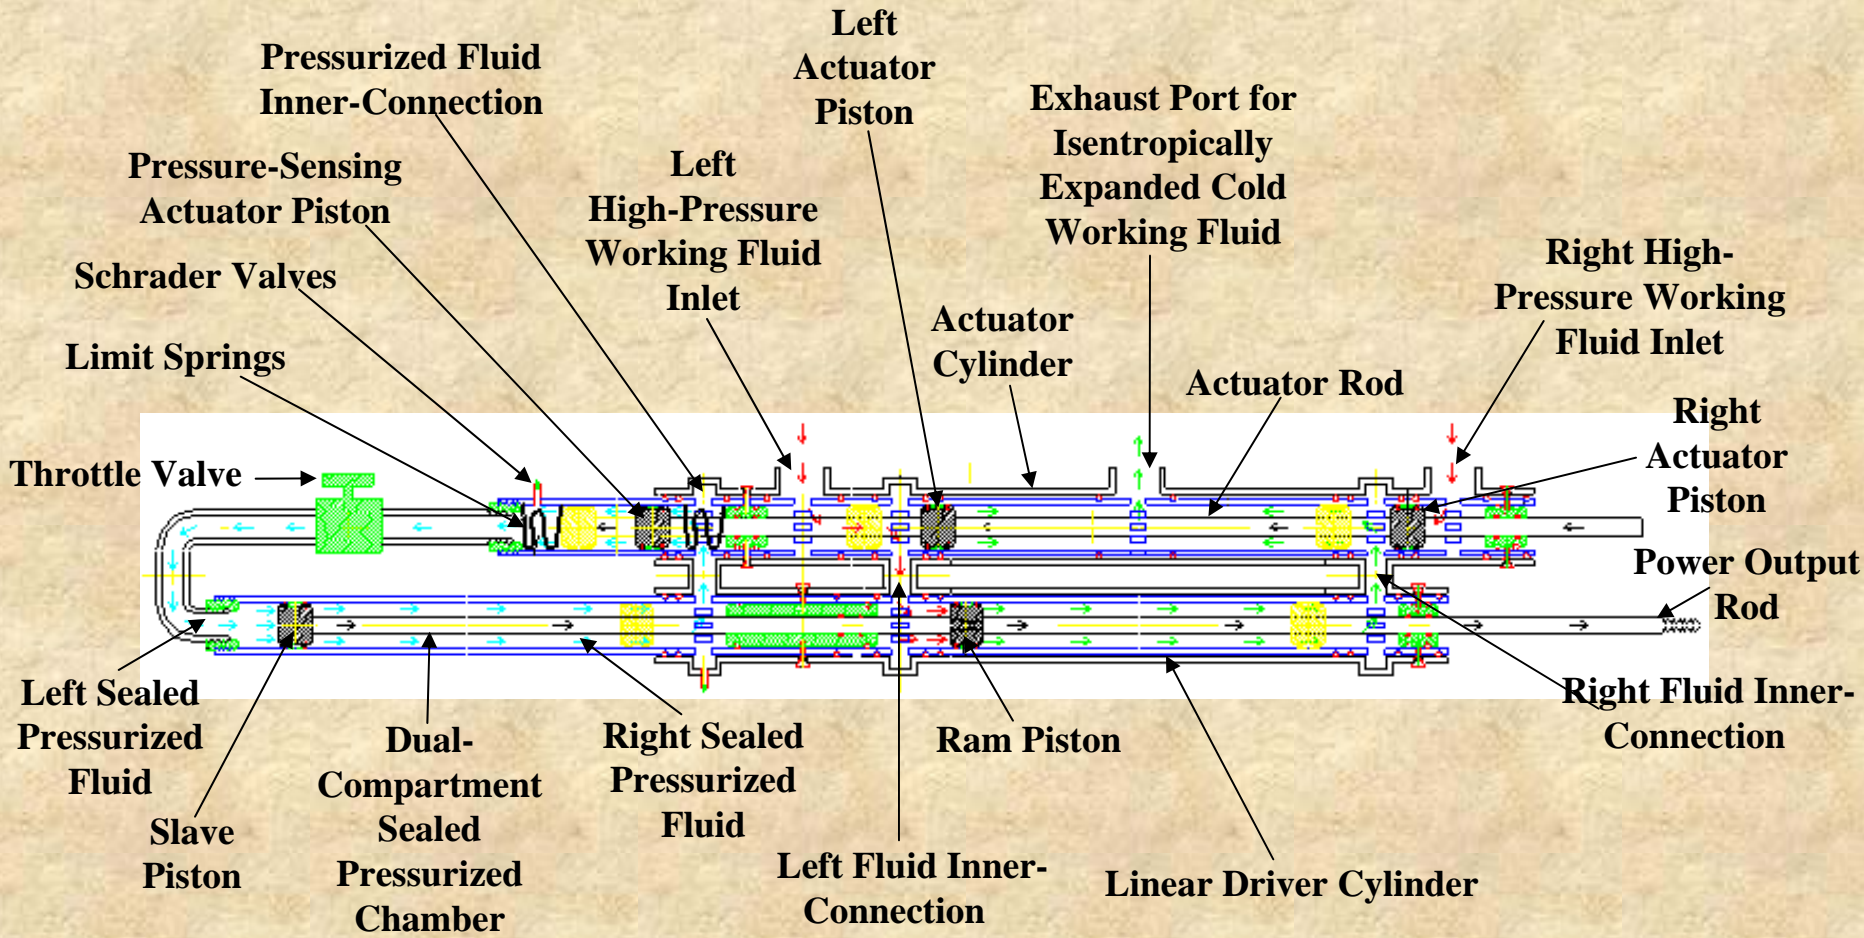

A New Type of Linear Engine Controlled by  
either a Cooled Solenoid Actuated Linear  
Driver or a Pressure Actuated Linear Driver that  
Controls the Flow of Working Fluid into  
Pneumatic or Hydraulic Style Rams, which  
Always Maintains an Optimum 90 Degree  
Vector Angle for Maximum Energy Transfer  
Efficiency

Solenoid Valves with Exhaust Cooled Coils actuate Positive Displacement Pistons by alternately switching the input and exhaust of a Linear Driver in order to Produce a Reciprocating Motion of the Power Output Rod

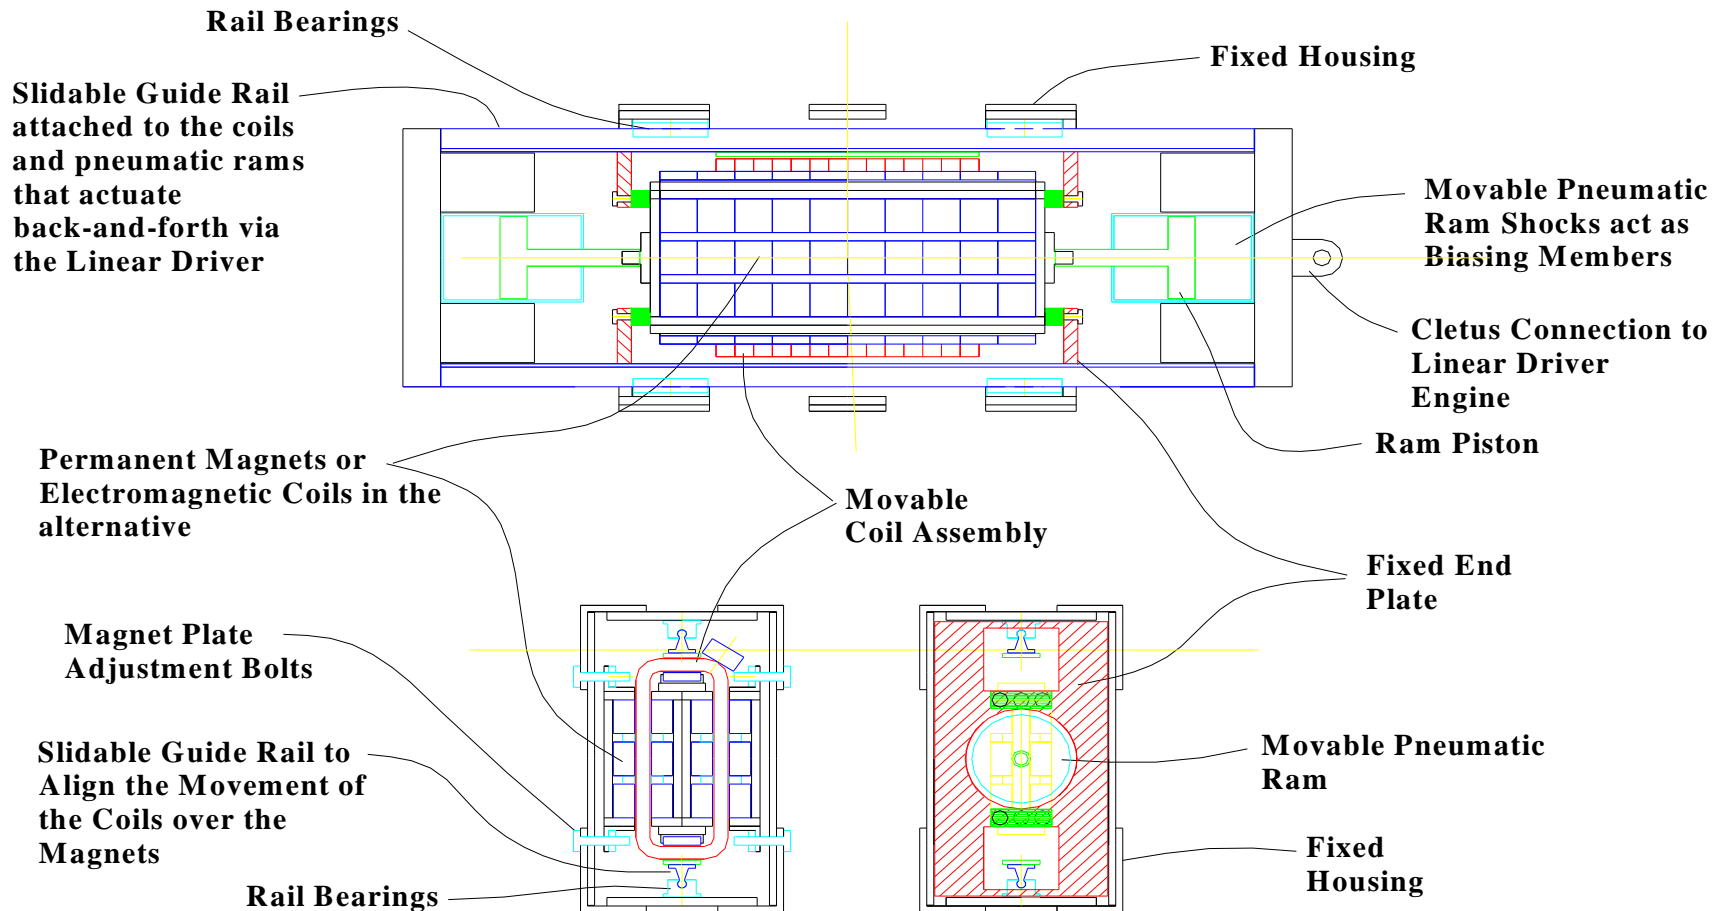

Pressure-Actuated Dual-Compartment Sealed Pressurized Chamber actuates Positive Displacement Pistons by alternately switching the input and exhaust of a Linear Driver in order to produce a Reciprocating Motion of the Power Output Rod

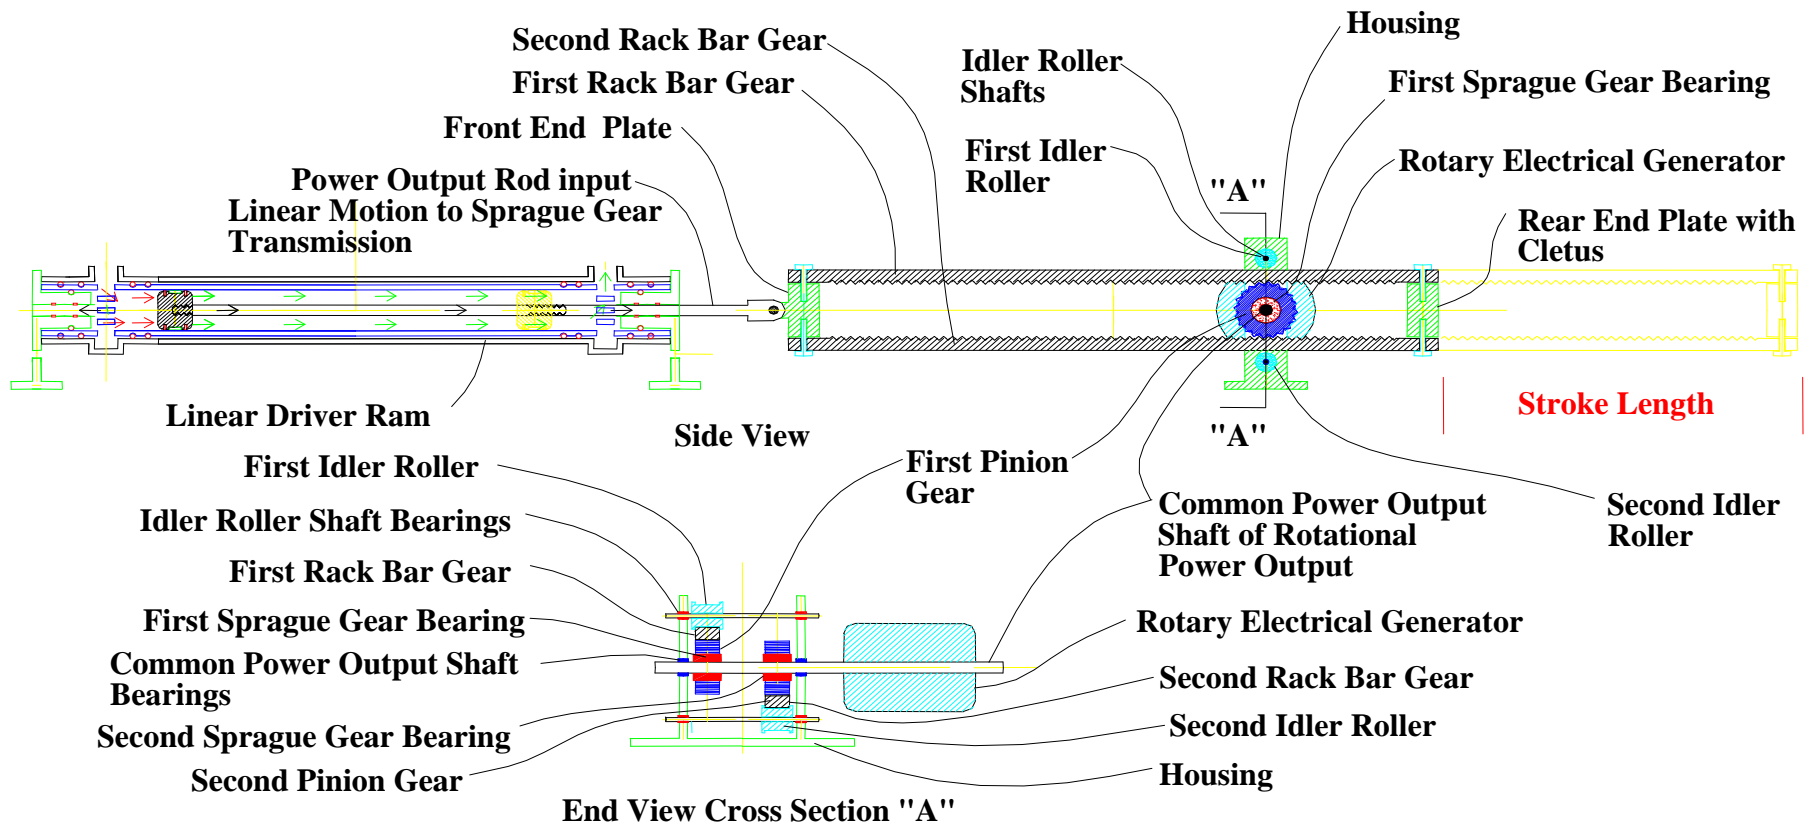

Non-Cogging Linear Alternator having Ferrous Metal Free  
Coils that Provide No Torque Startup and Reduced Loading

**Linear Alternator (320) Detail of Figure Three**

# Sprague Gear Transmission that Maintains an Optimum 90 Degree Vector Angle of the Power Output Rod to Efficiently Convert Linear Motion to Rotary Motion Power.

**Sprague Gear Transmission (340) Detail of Figure Three**

Exhaust Cooled Solenoid Valve Designed for Continuous High-Speed Operation Capable of Handling Large Volumes of Fluid Flow Without Failure due to Heat Build-Up.

# The Linear Driver Engine

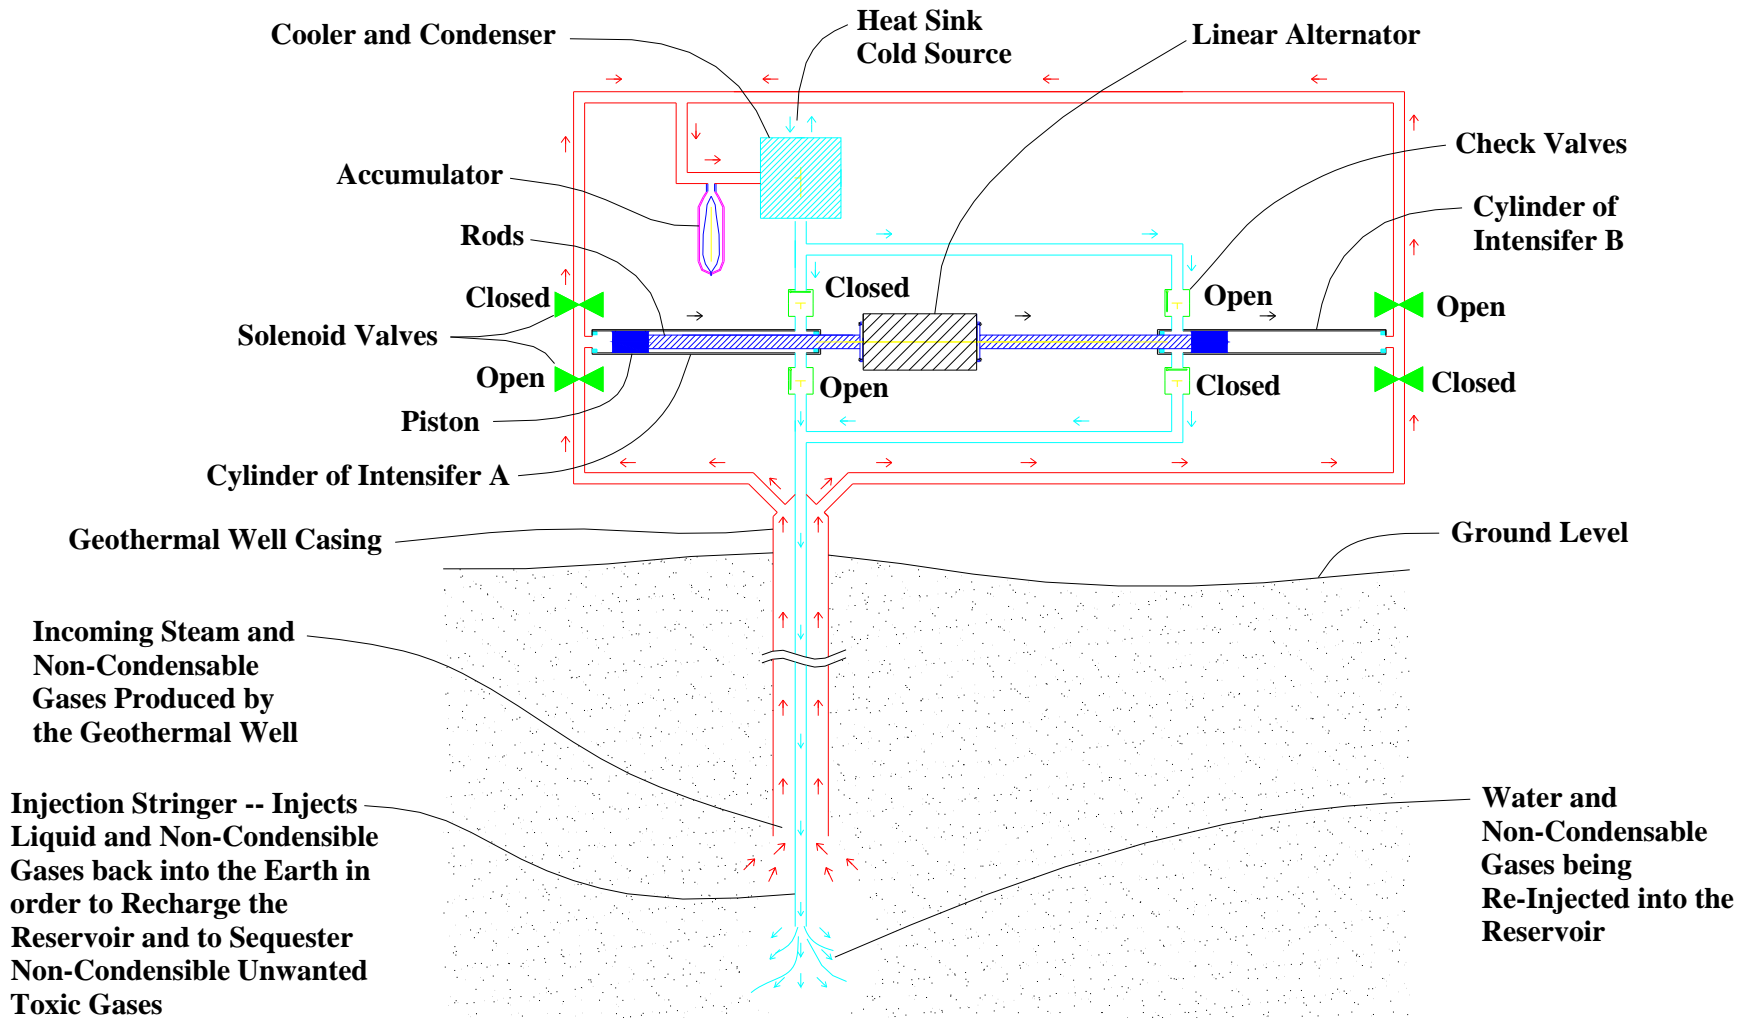

# Typical System Applications of the Ultra-Low-Temperature Technology

# Vertical Geological Fracture that Eliminates Land Area Use and Long Piping Runs for Water Re-injection

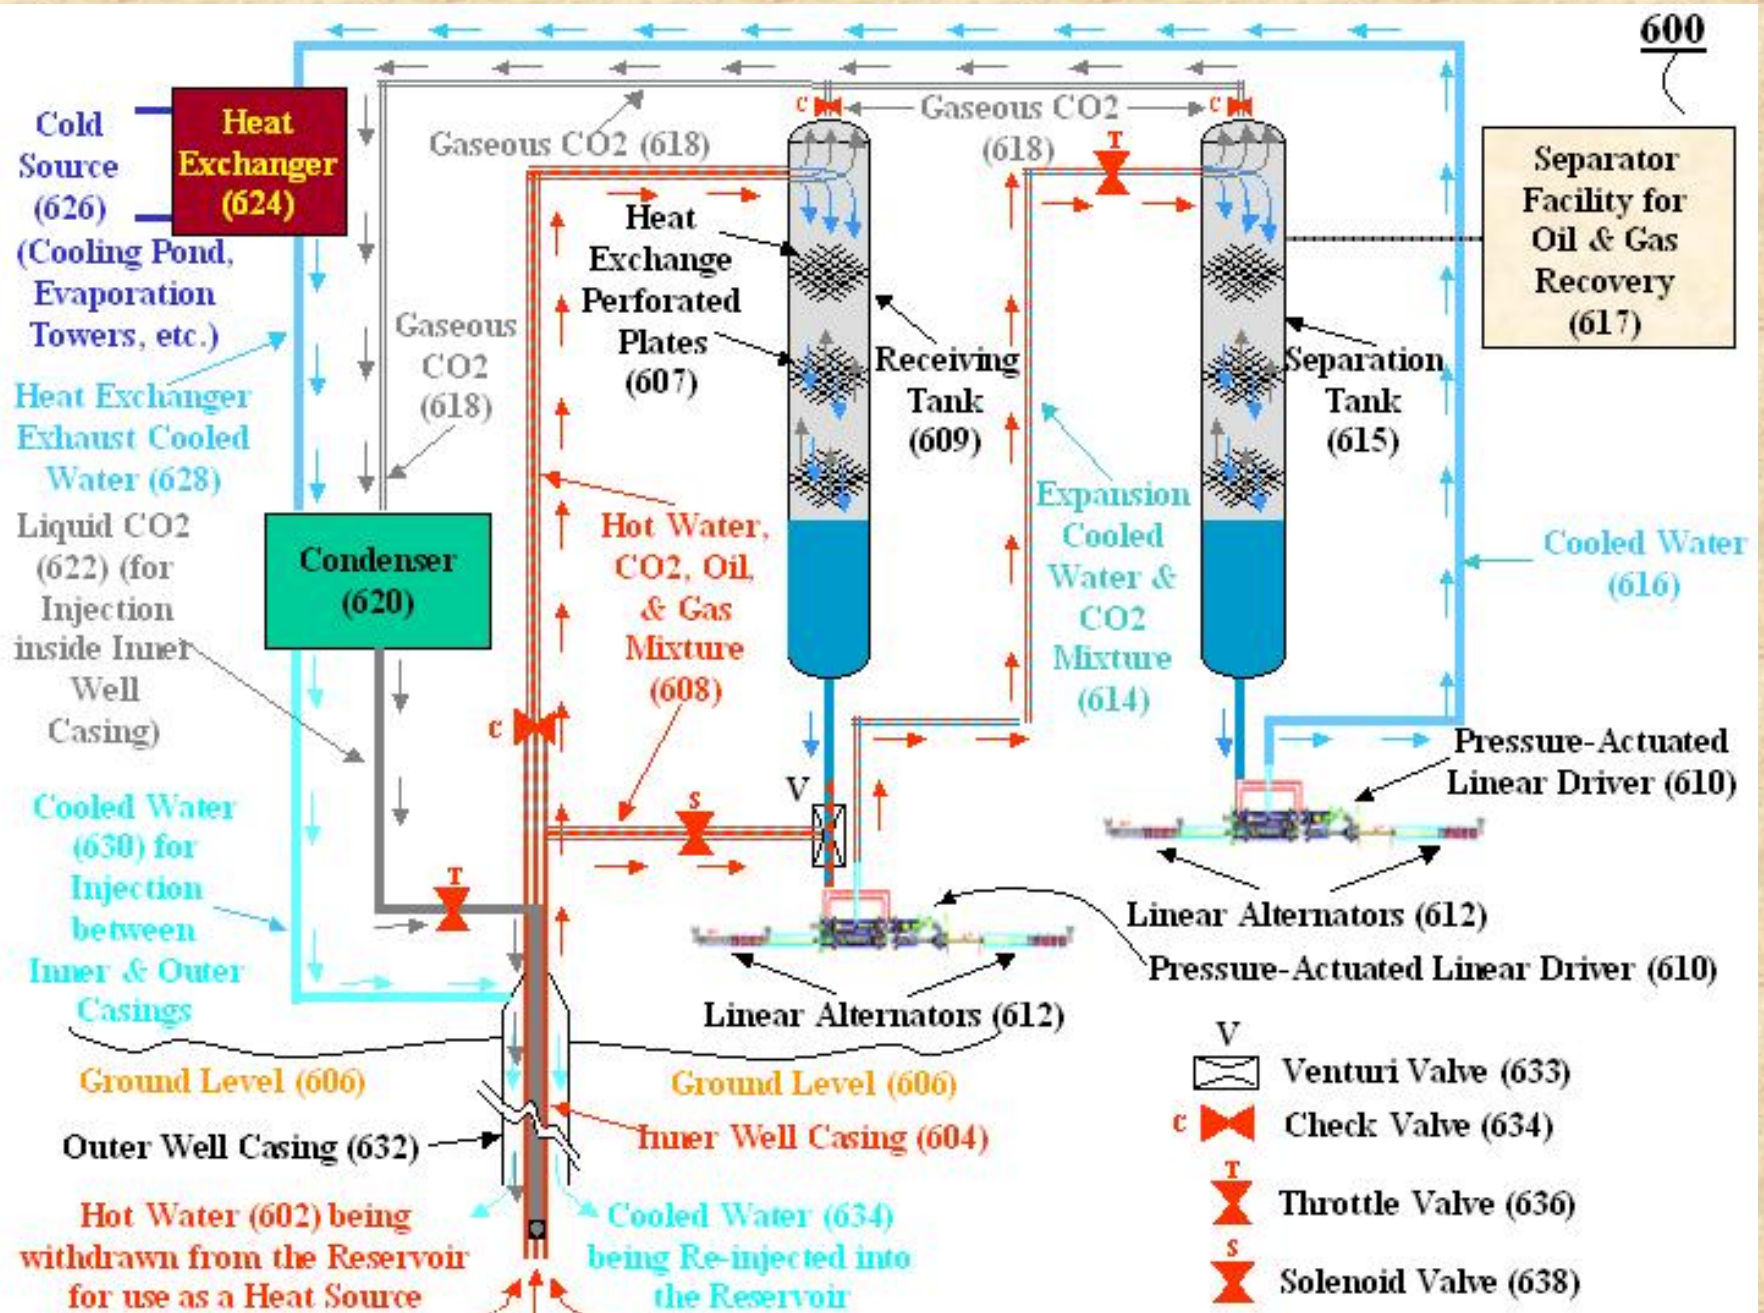

# Multiplication of Force at Equalized Pressure Power Cycle

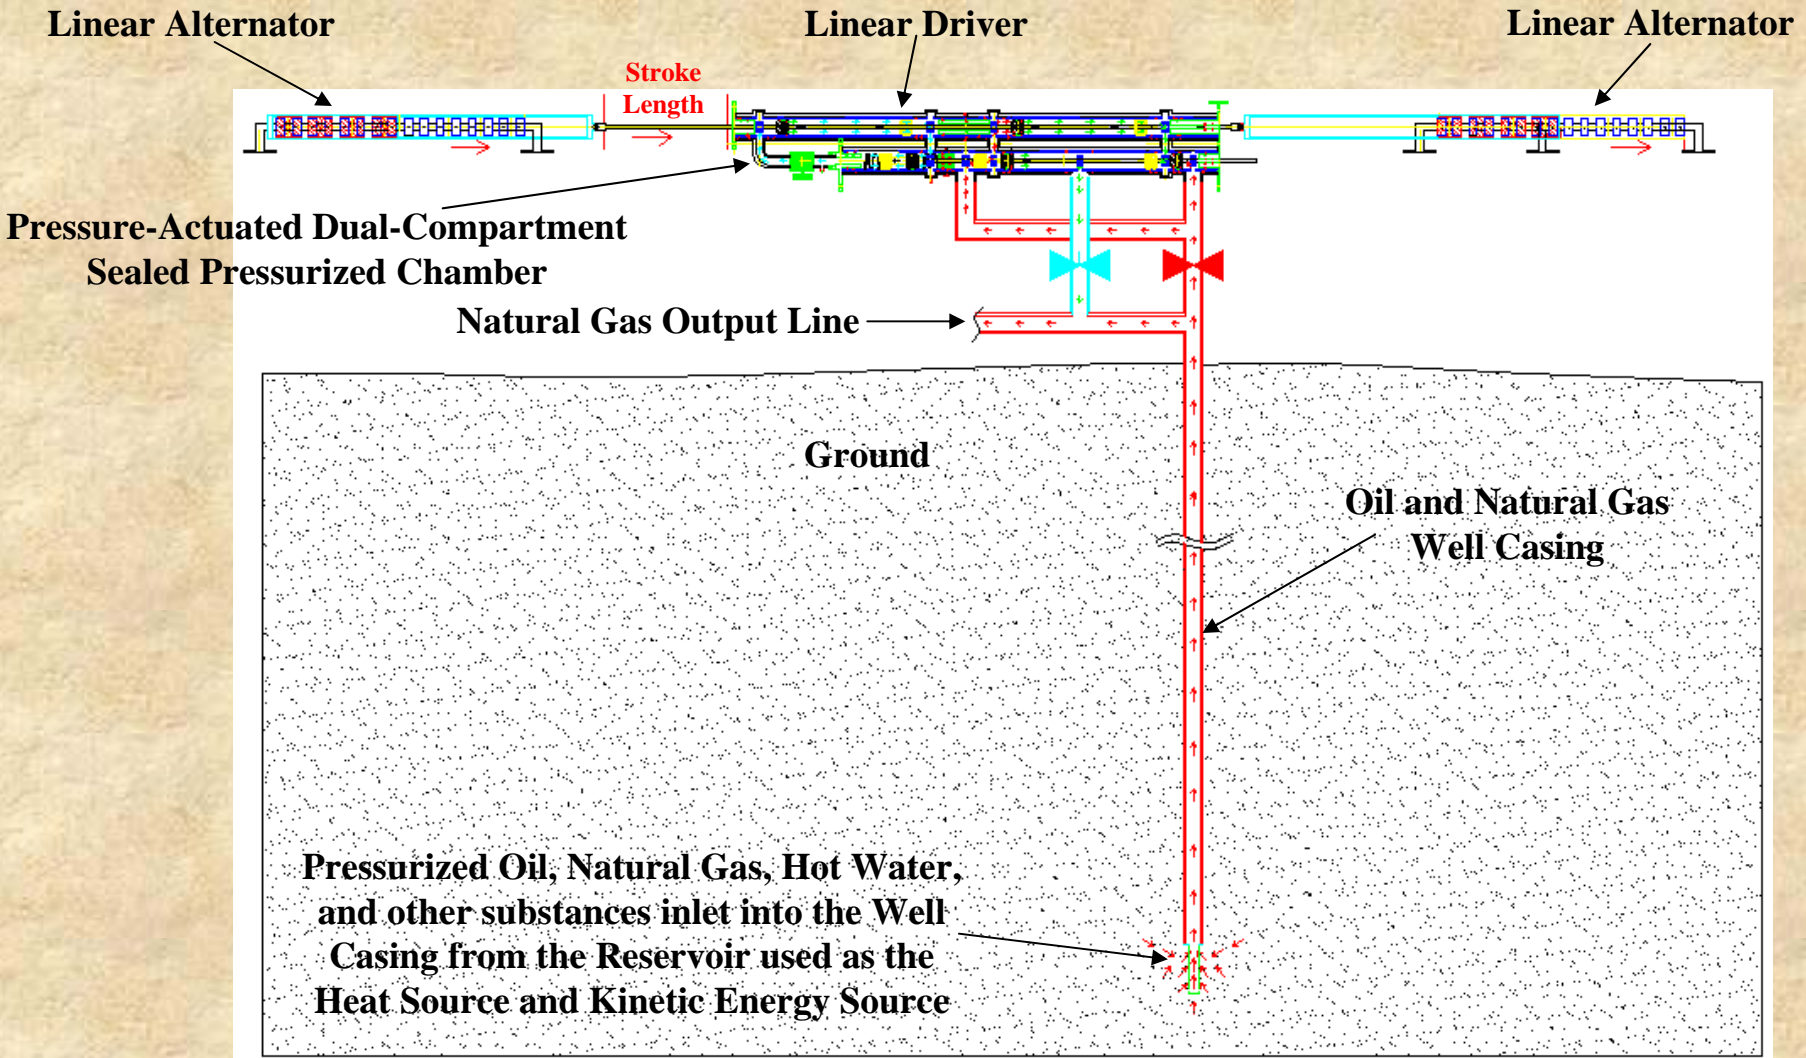

# Liquid Propane Well Injection Test

# Oil and Gas Well Injection Geothermal Power Generation

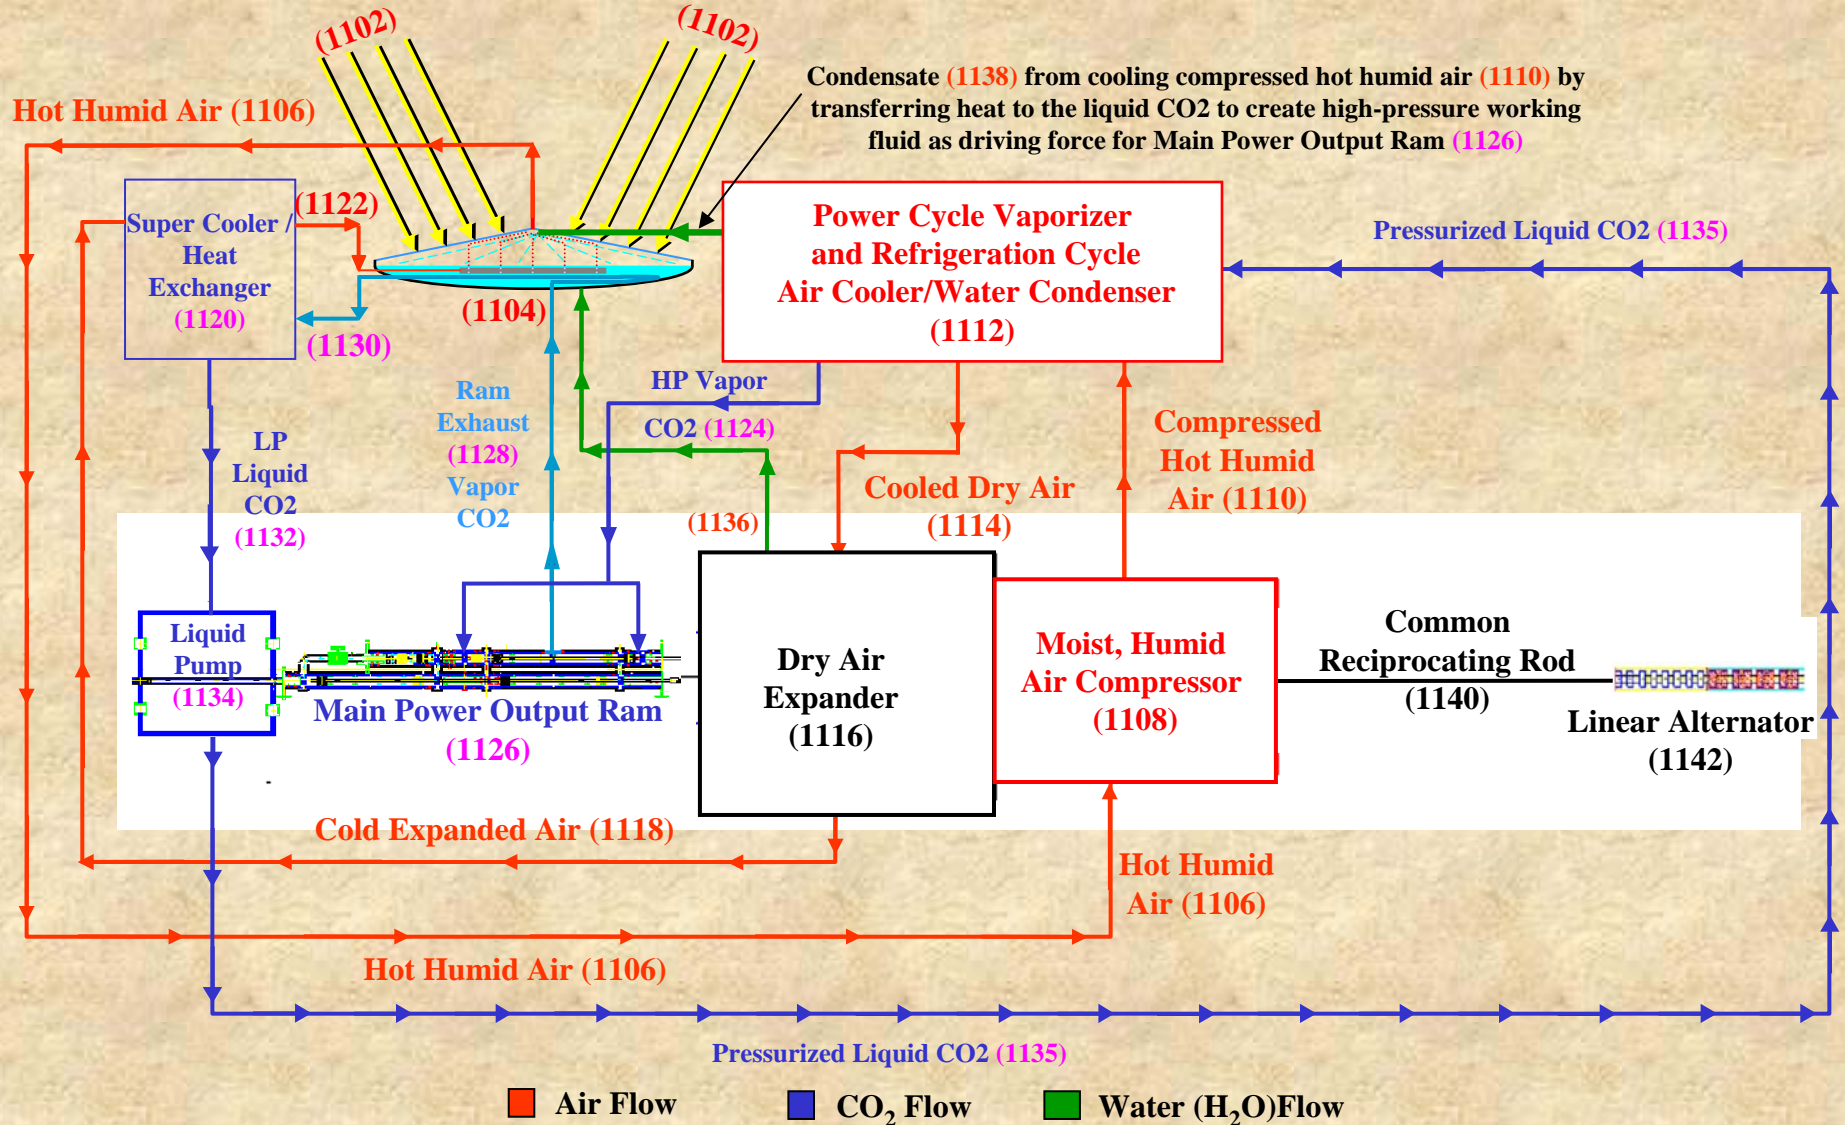

Pressure Actuated Linear Driver and Linear Alternators to produce an Electrical Power Output from the Kinetic Energy (Pressure) of Natural Gas Well

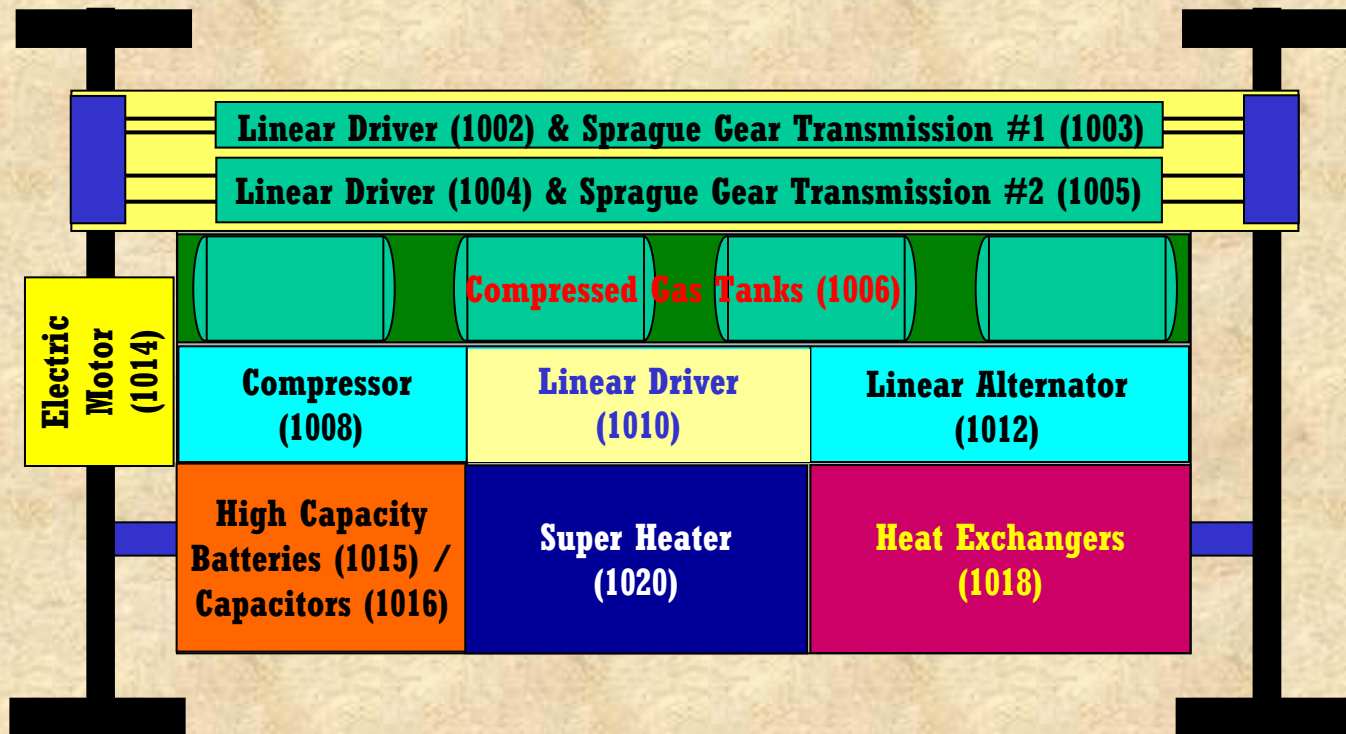

# Solar Air Conditioning and Heating Process

Low Temperature Heat Source (1102) (Solar) for conversion of Warmed Dry Air (1122) to Humid Heated Air (1106) in Solar Humidifier (1104)

# Low-Temperature Automotive Positive Displacement Power Generation with No Nitrous Oxide Emissions

# High Carnot Thermal Efficiency, Ultra-Low Temperature All Gas Phase Power Cycle with Closed-Loop Evaporative Cooling, Refrigeration, and Heating Cycle (800)

Low-Temperature Heat Source (801), such as Geothermal Heat, Solar Heat, or Ocean Thermal Energy Conversion (OTEC), into Refrigeration Cycle Evaporator to Drive the Evaporation Process, having a temperature range of approximately 80 deg. F. to 140 deg. F.

Snow or Ice (if any) to Evaporator from any Remaining Water Vapor (842) that is Condensed during Expansion of Air to Super-Cold State

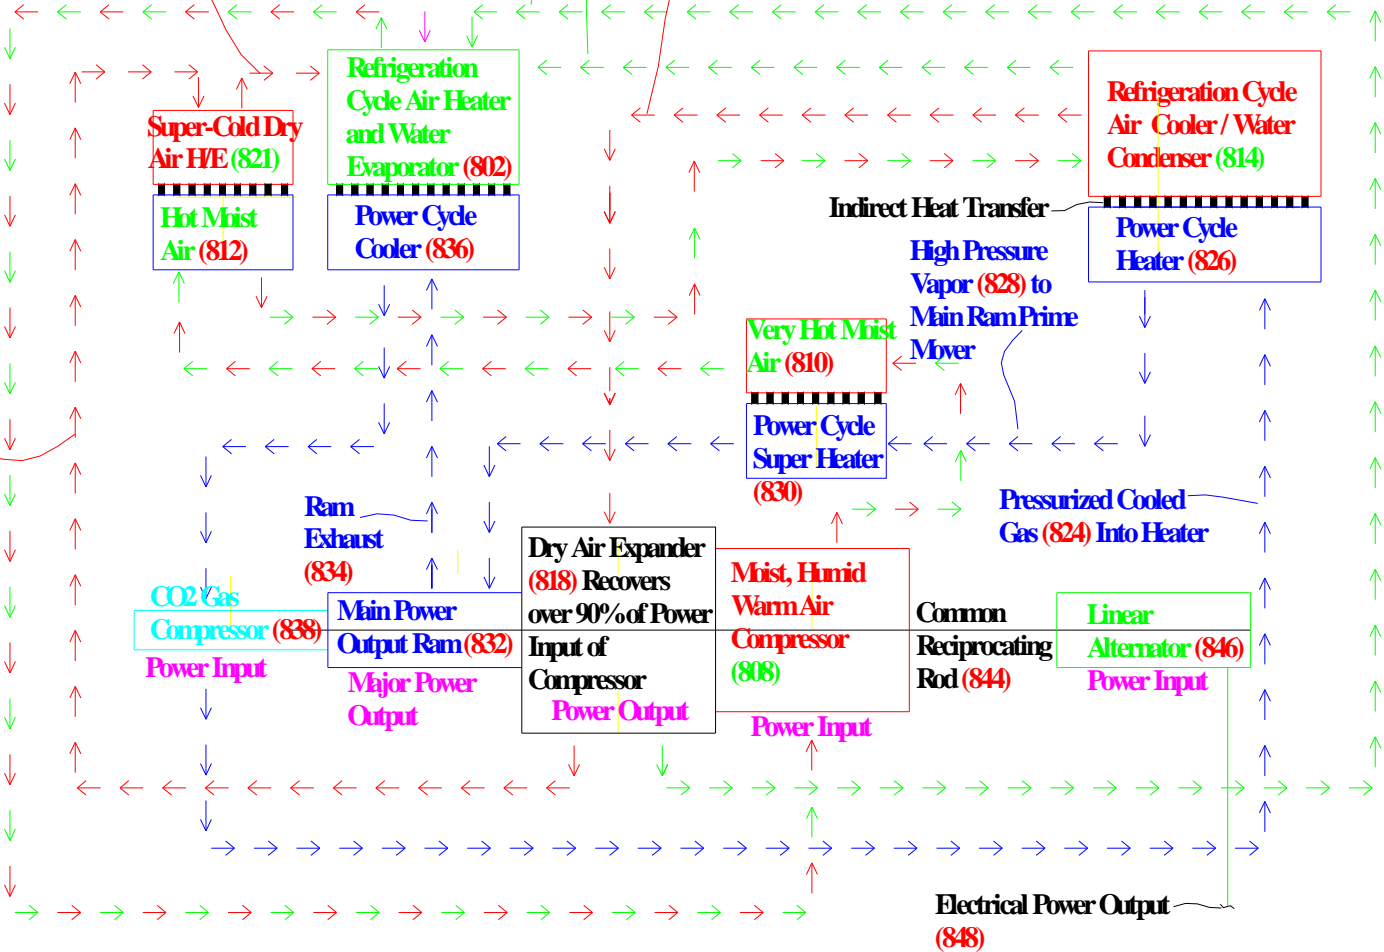

Closed-Loop, Pressurized Warm to Hot Water (840) being the Primary Water Supply to Refrigeration Cycle Evaporator

Dry Air (822) Warmed by Hot Moist Air H/E

Dry Air (816) Cooled by Power Cycle Heat Exchange with CO<sub>2</sub>

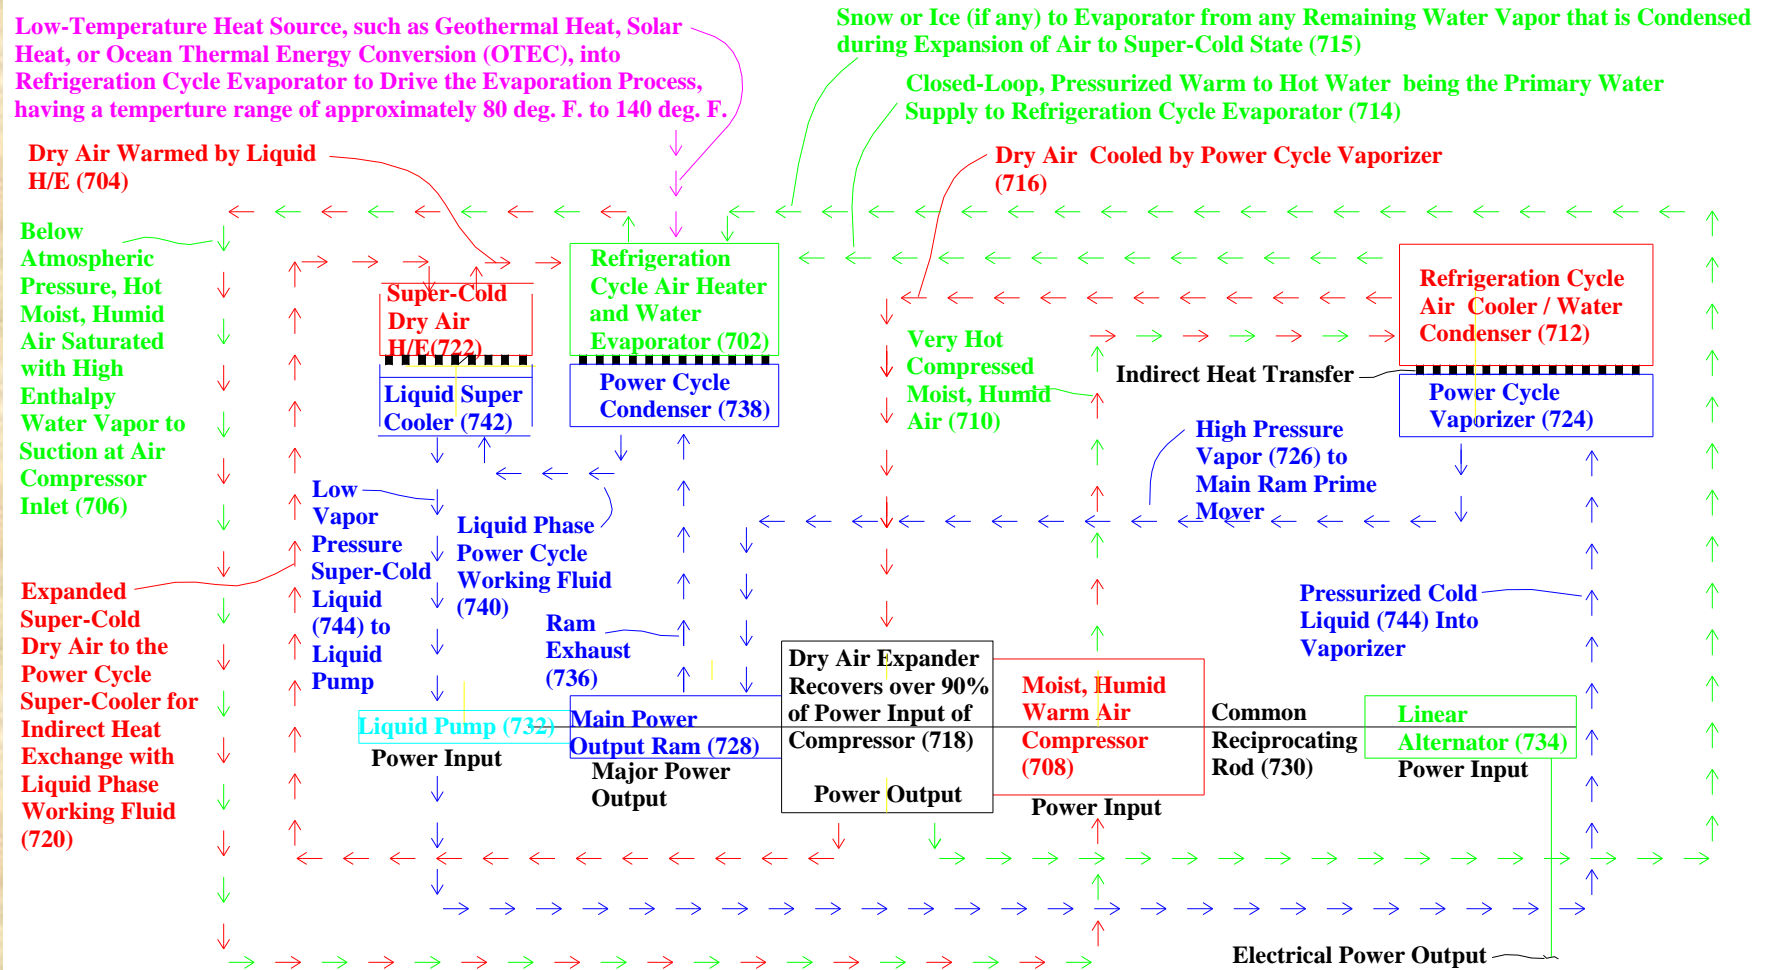

Below Atmospheric Pressure, Hot Moist, Humid Air (806) Saturated with High Enthalpy Water Vapor to Suction at Air Compressor Inlet

Expanded Super-Cold Dry Air (820) to the Power Cycle Super-Cooler for Indirect Heat Exchange with Liquid Phase Working Fluid

# High Carnot Thermal Efficiency, Ultra-Low Temperature Power Cycle with Closed-Loop Evaporative Cooling, Refrigeration, and Heating Cycle with Sufficient BTUs for Phase Change

# High Carnot Thermal Efficiency, Ultra-Low Temperature All Gas Phase Power Cycle with Closed-Loop Evaporative Cooling, Refrigeration, and Heating Cycle

Low-Temperature Heat Source (801), such as Geothermal Heat, Solar Heat, or Ocean Thermal Energy Conversion (OTEC), into Refrigeration Cycle Evaporator to Drive the Evaporation Process, having a temperature range of approximately 80 deg. F. to 140 deg. F.

Snow or Ice (if any) to Evaporator from any Remaining Water Vapor (842) that is Condensed during Expansion of Air to Super-Cold State

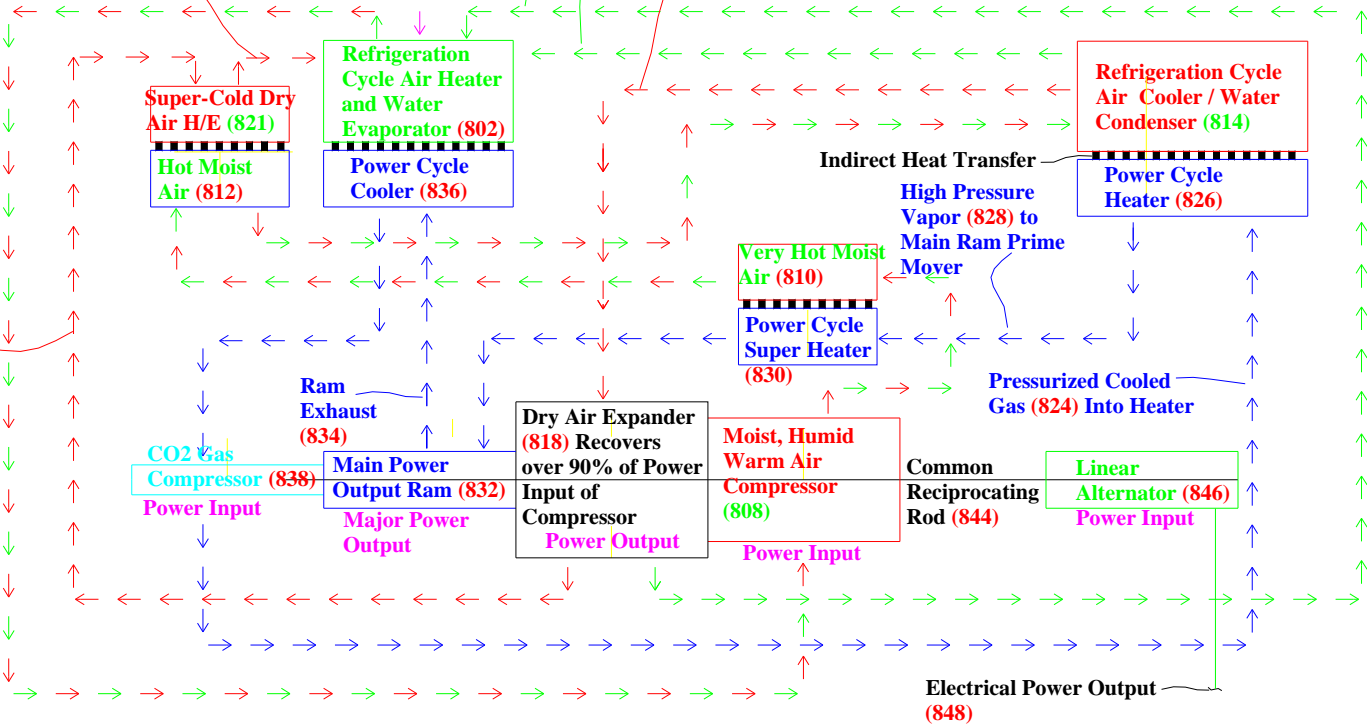

Closed-Loop, Pressurized Warm to Hot Water (840) being the Primary Water Supply to Refrigeration Cycle Evaporator

Dry Air (822) Warmed by Hot Moist Air H/E

Dry Air (816) Cooled by Power Cycle Heat Exchange with CO<sub>2</sub>

Below Atmospheric Pressure, Hot Moist, Humid Air (806) Saturated with High Enthalpy Water Vapor to Suction at Air Compressor Inlet

Expanded Super-Cold Dry Air (820) to the Power Cycle Super-Cooler for Indirect Heat Exchange with Liquid Phase Working Fluid

Electrical Power Output (848)

Thank You
